

A handbook for the board, the secretariat and the bank

Majlis is where a Shariah board does its work and keeps its record. The bank asks a question. The board answers it against the conditions of a named contract. The answer comes out as a document the bank can file, cite and be audited against.

This handbook covers every screen and every tool. Each section says what you see, what you press, and what happens.

19

contract types, in ten families

89

conditions the board can rule against

6

calculations, none of them a verdict

3

languages, including right to left

Why this exists

A Shariah board decides what a bank may and may not do. Today most of them do it with email, spreadsheets and a folder of PDFs.

The problem is not that boards decide badly. It is that nothing holds the decision.

A ruling is written once and then lives in an attachment. The conditions attached to it are read by whoever remembers them. A review date sits in someone's calendar until that person leaves. A pool that was 51% tangible when the board approved it drifts to 47% and nobody finds out until the audit. A desk that wants to know whether it may sign an agreement asks a scholar by email and waits nine weeks.

Majlis holds all of it in one record. The question arrives from the bank with the contract attached. The board judges it against the conditions of a named contract type, one condition at a time, each answer carrying the name of the member who gave it and the reason they gave. The vote needs the number of signatures the board's own constitution requires. What comes out is a document, and the conditions the agreement failed come back as clauses it has to add.

What the bank gets is three screens: what it asked and what became of it, what binds it today, and what it still owes. No email thread, no attachment, no waiting to be told what was decided six months ago.

What the board gets is its own record: every ruling, every reason, every position, searchable, with the review dates and the drifting numbers watched for it. And an audit export that answers, for any date, what was permitted, who approved it, on what reasoning, and who dissented.

Majlis never decides anything. Every calculation shows its arithmetic and stops; every reading quotes the contract and stops. The ruling is the board's, in the board's words, and the software's job is to make sure that nothing else is ever mistaken for it.

21. Every address

1 • How it works, in one page

1. **The bank asks.** Someone at the bank fills in four boxes and attaches the contract. The contract is read on the bank's own computer; the file never leaves it.
2. **The board takes it up.** A member turns the question into a matter and writes how the board will put it.
3. **The board picks the contract type.** Murabaha, ijara, sukuk and sixteen others. Picking one loads its conditions as the steps of the work.
4. **The board answers each condition.** Met, not met, or does not apply. Every answer needs a reason, and the reason is signed with the member's name.
5. **The board argues and votes.** Each vote carries a reason. A ruling needs the number of votes the board's own rules require.
6. **The bank gets the document.** Every condition, every answer, every reason. Conditions marked *not met* come back as clauses the agreement has to add.

The whole path takes about ten minutes to demonstrate and is written out step by step in section 7.

2 • The parts of every screen

Once you know these five things, every screen is familiar.

THE BOARD'S HOME SCREEN

The list on the left

Eight places, in three groups.

GROUP	WHERE IT TAKES YOU
The work	What needs you · Events · Coming
What stands	Rulings · The record · Search
What we hold	The register · The contract library

The bank sees a shorter list of its own. Section 4.

The bar along the top

Your name, search, the language (English, Arabic, Urdu), and a button that is on every screen: **Ask the board**. The bell next to your name lights up when the record has changed since you last looked.

The tools down the right

Seven buttons, always in the same place: screening, purification, zakat, profit distribution, tradability, late payment, and the list of everything that has been worked out so far. One press opens the tool over the page you are on. Section 8.

The bar along the bottom

Four short facts about this installation. They are there so nobody has to guess why a button is missing.

Nothing here signs on the board's behalf · Terms are carried out elsewhere · No assistant is configured · Nobody outside is told

If the bank has connected email, the same bar says *Notices are sent* instead. If it has connected the registry, it says *Terms are read before every transaction*.

The confirm window

Nothing is saved until you confirm it in a window. The window tells you three things first: what the button does, what it means, and what happens afterwards. If the server refuses, the refusal appears in the same window.

3 · Who can do what

There are five kinds of user. A board member can also hold an office: chair or secretary.

	SIGNATORY	ADVISORY	LIAISON	OBSERVER	BANK
Read the record	yes	yes	yes	yes	its own
Ask a question	yes	yes	yes	—	yes
Take a question up, answer conditions, argue	yes	yes	yes	—	—
Vote	yes	—	—	—	—
Record what the bank did	—	—	yes	—	yes
Keep the minutes	chair or secretary only				

- **Signatory** — votes. A ruling needs the number of signatories the board's own rules require. On the demonstration board that is three of five.
- **Advisory** — takes part in everything except the vote.

- **Observer** — reads everything, changes nothing.
- **Bank** — the institution's own desk, with its own three screens.

A password tells Majlis who you are. It is not a signature. Signing a ruling with a scholar's own key is a later stage of the product, and the bar at the bottom of every screen says so until it exists.

4 • The bank

The bank gets its own application, not the board's with half of it greyed out. Three screens.

THE BANK'S SCREEN

Asking a question

Four boxes:

BOX	WHAT GOES IN IT
One line to find it by	a short title
What you are asking	the question itself. It is never edited by anyone
What the board needs to know	background
What you are waiting to do	what is held up while you wait

Then attach the contract. Press **Choose a file** and pick the PDF. Majlis reads the words out of it on your own computer and shows how many characters it found. The

file itself is not uploaded anywhere.

If the PDF is a scan, Majlis says so and will not take it. A scan has no text behind it, so reading it would produce a list saying every condition is missing, which would be wrong.

Press **Put it to the board**, then confirm in the window. The question appears in the list below, marked **WAITING**.

Each question in that list shows where it got to:

- **WAITING** — with the board. You can still withdraw it.
- **TAKEN UP** — the board is working on it. There is nothing to read yet, and the row says so.
- **DECLINED** — with the board's reason, in full.

When the board has decided, the same row offers **the ruling, written up**. That is the document itself.

What binds you

Every ruling in force today, written for someone who has to follow it: the condition, the figures, and a link to check a contract against it.

What you may deal in

The same information from the other side: the instruments your desk may use, and the condition attached to each.

What you owe

Where the board found that something went wrong: what money is owed, to whom, and which steps are still open.

Check a contract

Attach a draft and see, condition by condition, where the agreement answers it and where it does not, with the passage quoted. Nothing is uploaded here either.

A ruling that has passed the vote but is still in its waiting period does not appear under *What binds you* yet. The document says on its front page when it takes effect.

Taking a question in for someone else

Most questions arrive by email from someone who will never have a login. The secretary types it in using the same form, with one extra box: **who actually asked**. The record shows that it was entered on their behalf.

Sorting the queue

THE QUEUE

Oldest first. Two buttons on each question: **Take it up as a matter**, or **Do not take it up**. Declining needs a reason, and that reason is the only thing the bank gets back.

Calling a sitting

SITTINGS

Majlis does not host the call. It keeps the record of it.

- An agenda is required. Without one the button refuses and says why.
- Mark who attended. Quorum is worked out from that.
- **The board book** collects everything for the sitting into one document to send out beforehand.
- The chair or the secretary keeps the minutes.
- Closing the sitting puts the minutes into the record.

Recording what the bank did

A liaison, or a member holding the secretary's office, can record something the bank did: a plan filed, a payment made, a step delivered. The record shows who entered it and on whose behalf.

What needs you

Everything waiting on somebody, in one list. It is worked out fresh from the record every time, so it never shows something you have already done. Each row says how long it has been waiting, what it is, what to do, and whose turn it is. The filters across the top are Everything, Asked, Deciding and Checked, with a count on each.

Events

Reported breaches. Section 15.

Coming

Every date the board is held to. Section 10.

Rulings

The screenshot shows the 'What we decided, and what stands' page on the Gravitas Majlis platform. The page is titled 'In force' and lists three rulings. The first ruling, 'A restoration window before a pool is reclassified' (2026-07-28), is marked 'IN FORCE'. The second ruling, 'Suspension of an asset following a change in its underlying structure' (2026-06-19), is marked 'LAPSED'. The third ruling, 'Secondary trading of a mixed pool at market price', is marked 'IN FORCE'. The page includes a sidebar with navigation links like 'THE WORK', 'WHAT STANDS', and 'WHAT WE HOLD'. A top navigation bar contains search, 'Ask the board', and language options.

What is in force, and when each one comes back for review.

Open one and you get the whole thing: the figures it fixes, the reasoning, every position recorded with its reason, its reference number, its review date, and what it deliberately does not decide.

The screenshot shows the 'Tangible asset ratio for secondary trading of mixed pools' page. The page is titled 'In force' and includes a 'VERSION 3' badge. The main text states: 'Where a tokenised pool combines asset categories, tokens may be traded in the secondary market at market price only while tangible assets and usufructs constitute the majority of the value of the pool.' A section titled 'What this means from day to day' explains that the ruling answers six questions in a specific order. A 'WHAT HAPPENS NEXT' box states: 'Nothing will bring this back to the board.' A 'THE FACTS' box lists: Version 3, In force from 2026-04-02, and Next review No review scheduled. The page includes a sidebar with navigation links and a top navigation bar.

ONE RULING

The record

Everything the board has settled, newest first.

The register

Everything the board rules on. Section 16.

The contract library

Nineteen contract types. Section 14.

Notes from the technical team

NOTES

What was changed on the technical side and what it asks of the board. Each note carries the one thing outstanding, in the same corner as every other record.

ONE NOTE

The assistant

If the bank has connected one. It explains how a contract works. It does not say whether anything is permitted. The screen names the model and says that the question leaves the building. If no assistant is connected, the screen says so instead of showing a box that fails.

The older screens

Nothing was deleted when the interface was simplified. The older list of matters, the older rulings page and the older home screen all still answer at their own addresses, so old bookmarks keep working.

THE OLDER HOME SCREEN

THE OLDER LIST OF MATTERS

7 • Working through a question

This is the main screen of the product.

A MATTER

The strip along the top is the whole job: **i** the brief, **01–06** the conditions, **V** the vote. One step fills the middle of the screen. The panels sit on the right. The buttons are along the bottom and never move. Left and right arrow keys move between steps. The step is part of the web address, so you can send a colleague the exact step rather than the matter.

A matter as it first opens, before anyone has chosen a contract type:

A MATTER, JUST OPENED

The order of work

- 1. Open it for deliberation.** Until then only its author has to read it. From here it appears on every member's list.
- 2. Choose the contract type.** A question from the bank arrives without one, because nobody has decided yet what kind of contract it is. The screen says so and shows the library. Choosing a type loads its conditions as the steps.
- 3. Answer each condition.** Three buttons: **Met**, **Not met**, **Does not apply**. A reason is required; the button stays dead until you write one. *Not met* is also written into the

contract clauses the bank gets back, with a line saying the agreement has to provide for it.

4. Argue it. *What was said* is the discussion. You can name a colleague, which puts it on their list.

5. Vote. The vote will not open until something has been said. Each position needs a reason. Where dictation is switched on, a member can speak the reason instead of typing it.

6. Close the vote. What happens next follows from the count and from whether the ruling permits or restricts something.

The panels on the right

Guidance – the question in the board's words and in the bank's, side by side.

The screenshot shows the Gravitas Majlis web application. The top navigation bar includes a search bar, a button to 'Ask the board', and a user profile for 'member-a' with a 'may vote' status. The main content area is titled 'Treatment of a tangible asset ratio breached by drift rather than by act' and is in the 'IN DELIBERATION' state. The left sidebar lists various sections like 'THE WORK', 'WHAT STANDS', and 'WHAT WE HOLD'. The main panel displays 'STEP 1 OF 6' with the text: 'Certificate holders own an undivided share in the underlying assets, with the rights and the exposures that ownership carries, rather than a claim against the originator.' Below this, it explains the distinction between asset-backed and asset-based securities. A text box prompts the user to 'What you read, and what it turns on. Kept with your finding.' On the right, the 'Guidance' panel is active, showing 'WHAT THE BANK ASKED' and 'WHAT IS NOT BEING DECIDED' with bullet points.

GUIDANCE

What was said – the discussion, with replies, and a button to ask a named colleague.

This screenshot shows the same Gravitas Majlis interface, but with the 'What was said' panel active on the right. The main content area remains the same. The 'What was said' panel displays a discussion thread. The first message is from 'member-a' dated 2026-07-21, discussing the immediate suspension and a grace period. The second message is from 'member-b' dated 2026-07-22, asking a related question about the period if the ratio is restored and breached again.

WHAT WAS SAID

Sources — standards, earlier rulings, documents and the draft itself, each with the relevant passage quoted. A member can mark a passage and write a note against it.

SOURCES

Limits — what this decision will not decide. Without this a ruling gets read as wider than the board meant it.

LIMITS

What the committee found — if the matter was sent to a committee first.

Changing an answer

Record the same condition again with a different answer. The earlier one stays in the history, marked as superseded. Nothing is deleted.

A decided matter

The same screen, with the work behind it: what was decided, the documents it produced, and — if the registry is connected — whether what is on the chain still matches.

8 • The tools

Seven buttons on every screen. Six of them are calculators.

THE TOOLS

All six work the same way. You type the figures, they show the arithmetic, and they

answer, not the software's. The working is always shown, so anyone can check it or disagree with it. Money is handled as exact decimals throughout, never as rounded numbers.

Screening

Three ratios, measured against the limits **the board sets**:

- interest-bearing debt,
- cash and interest-bearing securities,
- non-permissible income.

You also choose what to divide by — market capitalisation or total assets. Each ratio comes back with its top line, its bottom line, the limit it was compared against, and whether it is over.

Purification

What has to be given away from a holding that passed screening and still carries some non-permissible income.

There are three methods and they give different answers: per share, per dividend, per net asset value. You pick; the result says which was used.

This is not the same as purification after a breach. That one comes out of the bank's ledger and has a thirty-day clock on it. Section 15.

Zakat

The screenshot shows the 'Calculations' page in the Gravitas Majlis application. The page is titled 'Calculations' and includes a sub-header 'in force'. Below this, there is a description: 'The arithmetic a board does on its own figures. Every sum is shown and none of them reaches a verdict. Where two methods disagree, the board chooses.' The page is divided into two main sections: 'Screening' and 'Zakat'. The 'Zakat' section is currently selected and highlighted. It contains a description: 'The base, the rate and who bears it are three separate decisions, and this asks for all three before it computes anything.' Below this, there are two radio button options for 'THE BASE': 'Net assets' (selected) and 'Not invested funds'. The 'Net assets' option is described as 'Cash, receivables, trade goods and zakatable investments, less liabilities falling due within the year.' The 'Not invested funds' option is described as 'Paid-up capital, reserves, retained earnings and profit, less fixed assets, long-term investments and accumulated losses.' Below these options, there is a section for 'THE YEAR' with the text: 'The rate follows the year, and the difference is not a rounding question.'

Three choices, all of them the board's:

- **The base** – net assets, or net invested funds. On the same balance sheet these do not have to agree.
- **The year** – 2.5% for a lunar year, 2.577% for a solar one.
- **Who pays** – the bank, the shareholders, or both. The annual report asks for this.

Profit distribution

The screenshot shows the 'Calculations' page in the Gravitas Majlis application, specifically the 'Profit distribution' section. The page is titled 'Calculations' and includes a sub-header 'in force'. Below this, there is a description: 'The arithmetic a board does on its own figures. Every sum is shown and none of them reaches a verdict. Where two methods disagree, the board chooses.' The page is divided into two main sections: 'Screening' and 'Profit distribution'. The 'Profit distribution' section is currently selected and highlighted. It contains a description: 'What the depositors are actually paid, and what the reserves did to it. PER comes out before the split so both parties bear it; IRR comes out after, from the depositors' share alone.' Below this, there is a form with three input fields: 'PERIOD FROM' (dd.mm.gggg), 'PERIOD TO' (dd.mm.gggg), and 'CURRENCY' (USD). Below these fields, there is a section for 'GROSS PROFIT OF THE POOL' with the text: 'Before anything is taken out of it.' Below this, there is a section for 'THE BANK'S SHARE AS MUDARIB' with a text input field containing '0'.

What the investment account holders receive. Two reserves, at rates and caps the board approves, applied in a fixed order:

- **PER** comes out of gross profit, before the split, so the bank and the depositors both carry it.
- **IRR** comes out after the split, from the depositors' share only.

The order is shown because the annual report has to state whether the split followed what the board approved.

Tradability

The screenshot shows the Gravitas Majlis web application. The left sidebar contains navigation links under 'THE WORK' (What needs you, Events, Coming), 'WHAT STANDS' (Rulings in force, The record, Search), and 'WHAT WE HOLD' (Register, Contract library). The main content area is titled 'Calculations' and includes a description: 'The arithmetic a board does on its own figures. Every sum is shown and none of them reaches a verdict. Where two methods disagree, the board chooses.' Below this is a list of calculation types: Screening, Purification, Zakat, Profit distribution, **Tradability** (selected), Late payment, and Recorded. The 'Tradability' section is expanded, showing a definition: 'Where a pool's composition fails against the bands this board set, and what the board wrote about that band. The proportion is arithmetic. Whether the paper may be traded is the board's ruling, in its own words.' It also includes a section 'TAKE THE FIGURES FROM THE REGISTER' with two options: 'Mixed pool – leased equipment and trade finance' (4 parts, 2026-06-30) and 'Sukuk al-ijara, five year' (5 parts, 2026-06-30). At the bottom, it lists various instruments: 'No composition is held for: Commodity murabaha for retail deposits, Wrapped staking position, Leveraged index instrument, Token whose underlying structure changed after approval, Cash-backed settlement token'.

Whether a pool can be traded at market price or only at par depends on what sits behind the paper: tangible assets, debts, cash, receivables. The tool gives you the mix and the tangible ratio, and names which rules each proportion falls under. Where the line is drawn is the board's ruling.

Late payment

The screenshot shows the Gravitas Majlis web application with the 'Late payment' section selected. The left sidebar is the same as in the previous screenshot. The main content area is titled 'Calculations' with the same description. The list of calculation types now has 'Late payment' selected. The 'Late payment' section is expanded, showing a definition: 'An increase charged on a late payment, and where it goes. Majlis works out the amount. You say whether the debtor could have paid. Anything not kept against evidenced costs is given away.' It also includes a section 'WHAT THE BOARD ESTABLISHED ABOUT THE DEBTOR' with two options: 'Able to pay, and delayed' (selected) and 'Unable to pay'. The 'Able to pay, and delayed' option has a sub-note: 'The board established that this debtor could have paid and did not.' The 'Unable to pay' option has a sub-note: 'The board found this debtor was in difficulty. The amount is still worked out, so the board can see what the contract would have produced. Nothing here says it is due.'

What is charged when a debtor pays late, and where it goes. The charge goes to charity. The bank keeps only what it can show it actually spent on collection, and only if the board allows that at all. There is no field for turning the charge into income.

What has been worked out

WHAT HAS BEEN RECORDED

Every calculation the board has recorded, newest first, with its working, who recorded it, and under which ruling. Any member can record one. Any member can withdraw one, with a reason, in their own name.

Recording a figure is not approving it, and every record says so.

Tools inside a step

When a condition needs a figure, Majlis opens the right tool inside that step and files the result against that condition. The panel tells you which of the two is happening, so nobody works out a figure and assumes it was saved.

Figures out of the contract

If a draft has been attached, the reader offers the numbers it found, each with the passage it came from, so nobody retypes six figures off a balance sheet. A number of the wrong kind is shown but cannot be used: *1.5% per month* appears beside a money box with its quote, and will not go into it.

One recorded figure

ONE CALCULATION

Every recorded figure has its own address, so a notice mentioning an amount can point at the working instead of just stating a number.

9 • Counters and clocks

Nothing here is a stored list of reminders. Every count is worked out from the record at the moment you look, so it cannot go stale.

COUNTER	WHERE	WHAT IT SAYS
What needs you	home screen and top bar	how much is waiting on you , and how much of it is late
Days here	every row in the queue	how long this has been waiting
Pace	the queue and the record	how long matters take, counted to the decision rather than to the effect
The count	the vote	for, against, abstained, the number required, and who has not voted yet, by name
Quorum	a sitting	worked out from who attended
Waited	a question from the bank	how long the bank has been waiting
The bell	the top bar	one number that goes up whenever the record changes
Answered	a matter	how many conditions have an answer, out of how many. No percentage and no progress bar

10 • The calendar

COMING

Every date the board is held to, in order: sittings, review dates, ratification deadlines,

Subscribing

You can subscribe to the board's dates from whatever calendar you already use. No email provider, no integration, no account — it is a web address your calendar reads.

The screen warns you before you press: anyone who has that address can read the board's dates. It is shown once, Majlis keeps only a fingerprint of it, and you can revoke it in the same place.

11 • What Majlis watches on its own

Four things go looking without being asked. All four report; none of them changes a ruling.

Drift. The board approves a pool that is 51% tangible. Months later it has rebalanced to 47%, and the ruling now describes something that no longer exists. Drift notices the difference and raises it. The status of the holding stays whatever the board made it.

Review. A review date is the only deadline in a board's work that nothing external pushes. Majlis compares the date to today and asks.

Lapsed deadlines. A restriction passed on a reduced quorum only stands if the full board ratifies it in time. Majlis marks it as lapsed when the window closes, instead of leaving a rule standing that nobody voted for.

Examinations. What was actually executed, compared with what the board approved.

EXAMINATIONS

The screen lists the differences. There is no score and no pass mark; the conclusion is the board's.

12 • The documents

Everything below opens, prints, and is built from the record rather than typed by hand.

DOCUMENT	WHAT IS IN IT	WHO CAN READ IT
The ruling	the question, every condition and its answer, who answered and why, the votes, the limits, and — while it is in its waiting period — the date it takes effect	the board, and the bank that asked
The contract clauses	a draft agreement built from what the board decided, with a clause for every condition marked <i>not met</i>	the board and the bank
The board book	everything for one sitting, in one document	the board
The compliance manual	every approved product and the conditions on it	the board and the bank
The annual report	the board's report to shareholders	the board
The audit export	what was permitted on a given date, who approved it, on what reasoning, with any dissent	the board
The matter pack	one matter with everything needed to decide it	the board
The dossier	everything the board ever decided about one holding	the board
Disclosure	what the bank still owes and still has to do	the bank

THE BOARD BOOK

A ruling gets its reference number when it comes into force, not when the question arrives. Most questions never become rulings, and numbering them all would leave gaps that look like missing decisions.

13 · Reading a contract

The screenshot shows the Gravitas Majlis web application. The header includes the logo, navigation links (Gravitas Majlis, Search, Ask the board, Guide, Go to, or open), language options (English, العربية, اردو), and a user profile (member-a may vote). The left sidebar lists categories: THE WORK (What needs you, Events, Coming), WHAT STANDS (Rulings in force, The record, Search), and WHAT WE HOLD (Register, Contract library). The main content area is titled 'Check a contract' and includes instructions for pasting a draft and a form for 'WHERE THE CONTRACT COMES FROM' with options 'A file from this computer' and 'Our draft: Secondary trading of a ...'. A right sidebar lists 'TOOLS' (S Screening, P Purification, Z Zakat, R Profit distribution, % Tradability, K Late payment, = Recorded).

CHECKING A DRAFT

Attach or paste a draft and Majlis goes through it condition by condition. For each one it reports one of three things:

- **found** — the draft deals with this, and here is the passage;
- **unclear** — something was found but it cannot be relied on;
- **absent** — nothing in the draft deals with it.

Found means the agreement addresses the condition. Whether it does so well enough is the board's decision.

There are two readers. The plain one works on the words alone: no model, no key, no network. The other uses a language model, where the bank has configured one; it pulls out passages and quotes them, and a quote that cannot be matched back to the text is downgraded to *unclear*. Which one ran is written on the reading.

14 • The contract library

THE LIBRARY

Nineteen contract types in ten families, with 89 conditions between them.

FAMILY	TYPES
Sale	murabaha (including commodity murabaha and tawarruq) · musawama · salam · istisna'
Lease	ijara · ijara muntahia bittamleek
Partnership	mudaraba · musharaka · diminishing musharaka
Agency	investment wakala
Securities	sukuk
Exchange	sarf
Security and transfer	kafala · rahn · hawala · wa'd
Interest-free lending	qard hasan
Insurance	takaful
Combination	combining contracts

READING A DRAFT AGAINST A TYPE

They arrive as drafts

Until the board does something with a contract type, its conditions are a starting point and bind nobody. Every screen that shows them says so.

The board can adopt one as it stands, change its conditions, decline it with a reason, or simply rule on a matter against it without adopting anything. The checklist always says which of those is the case.

ONE CONTRACT TYPE

Which type is this draft?

COMPARING TYPES

Pick from the list, or press **compare them all** and Majlis reads the draft against every type and ranks them. Pressing a ranked row only fills in the list; it does not choose for you.

15 • Breaches, undertakings, committees, sittings

A reported breach

EVENTS

Nine steps, in order: reported, stopped, determined, the bank's account of it, the plan, endorsed or sent back, what was delivered, purification and what was paid, closed. Each step has its own button, its own clock and its own record of who did it.

ONE EVENT

This is work that cannot wait for the next quarterly meeting. The thirty days run from the finding.

Undertakings

What somebody promised to do, and by when, attached to the matter it came from and to the person who owes it.

Committees

Part of the board, given a question to look at first. What they found comes back as a panel on the matter itself.

Sittings

The agenda, who attended, what was minuted, what was decided, and the board book that goes out beforehand.

16 • The register

THE REGISTER

Everything the board rules on: where each holding stands today, what it is made of, and whether it is conventional or tokenised.

ONE HOLDING

Open one and you get everything the board ever decided about it.

One thing to watch, and the screen says it too: if the same instrument is entered twice, it stays two entries. There is no way to merge them, so it will be counted twice in every total drawn from the register. Check before entering.

17 · Search

SEARCH

A board that has decided two hundred matters and cannot find the one from March has a filing cabinet, not a record. Search covers every stage at once, so you do not have to know which stage a ruling is in before you look for it.

PERMITTING IN DELIBERATION 2026-07-21

Treatment of a tangible asset ratio breached by drift rather than by act

IN THE TITLE

Treatment of a tangible asset ratio breached by drift rather than by act

TOOLS

- S Screening
- P Purification
- Z Zakat
- R Profit distribution
- % Tradability
- K Late payment
- = Recorded

SEARCH RESULTS

What the board already decided about a similar question also appears on the matter itself, offered as a suggestion the board can take or leave.

Demonstration Board (illustrative data only)

Who is on this board, and how it decides.

You, as you appear on a ruling

Name Title

Leave it empty if you do not use one.

Board Member A Shariah Board Member (placeholder)

Email Telephone

Your name and title are printed on every ruling you sign. Changing them here changes how you appear from now on: a ruling already signed keeps the name it was signed under.

TOOLS

- S Screening

- % Tradability
- K Late payment
- = Recorded

SETTINGS

- **The board** — who is on it, how it decides, and every time that changed.

- **Your details and password** — changed by you, from whatever device you have.
- **Your devices** — you can register a passkey and sign with it. This needs a secure connection; where there is not one, the screen says so rather than offering a button that fails.
- **Your calendar feed** — issued and revoked here. Section 10.

19 • Phone and tablet

A phone shows less at once than a desk does. It does not show less in total: everything reachable at full width is reachable on a phone.

ON A PHONE

- The bar at the bottom carries one place from each of the three groups.
- Under the title, the rest of the group you are in, scrolling sideways.
- The seven tools are a strip across the top.
- **Ask the board** is the round button in the top bar.
- The four facts about the installation are at the foot of the page.

THE LIBRARY ON A PHONE

A TOOL ON A PHONE

A matter works the same way, narrower.

A MATTER ON A PHONE

A tablet has room for the tools across the top and the whole group under the title.

ON A TABLET

A MATTER ON A TABLET

Arabic and Urdu are the same application, mirrored.

20 • What Majlis does not do

Stated here in one place, and stated again on the screen where it matters.

- **It does not decide anything.** No calculator returns a verdict. No reader says a contract is compliant. The assistant explains mechanics, not permissibility.
- **It does not pick a standard for you.** Which standard governs is the board's decision, written in the board's own words.
- **Nothing becomes binding by admin.** Changing what a board holds needs a ruling, not a setting.
- **It does not sign for the board.** A password identifies; it does not attest.
- **It does not stop a transaction** unless the registry is connected, and the bottom bar says which.
- **It tells nobody outside** unless email is connected. A notice is written and shown on screen; whether it was actually sent is stated, never assumed.
- **It does not host the meeting.**
